Customization Customization of AutoCAD allows you to modify the look and functionality of your application, change the appearance of buttons, menu items, and icons, control the appearance of windows, draw new dialogs, and insert dialogs into windows. There are three primary approaches to customization. Procedural Customization allows you to modify the menu, toolbar, and ribbon by inserting custom code into a dialog template or any other template file. A dialog template is a text file in the Windows directory with the extension.ddt. This file contains code written in an AutoLISP dialect. For example, you can insert code to change the label of a button or modify the appearance of a menu item. Character Customization uses a language called tag and string. For example, to change the label of a button, the tag looks like: . Object Customization allows the developer to create an application object that encapsulates functions that can then be inserted into a dialog template. For example, you can create an application object to manage drawing, zooming, text and objects. Once the application is inserted, you can create as many of these objects as you like. You can also create objects and have them appear on any template. This is an extremely powerful way to create a complete, custom application. Visual LISP Visual LISP was initially developed for the 1987 release of AutoCAD. It is an object-oriented programming language, much like Visual Basic or C#, and is used for writing add-ons, toolbars, and menus for AutoCAD. The visual LISP IDE has two modes; Visual LISP mode is for non-AutoCAD programmers and the other mode is AutoCAD LISP mode, which is a visual version of AutoLISP for AutoCAD programmers. AutoLISP AutoLISP was developed for the 1987 release of AutoCAD. It is used for writing add-ons, toolbars, and menus for AutoCAD. The language has a visual, tree-based editor, and resembles an array of C++ nested classes, although the actual code is written in C++. It is also used for writing AutoCAD applications, either within a VBA macro, or as an AutoCAD add-on. AutoLISP is one of the oldest programming languages in use within AutoCAD. Introducing the 2019 release of AutoCAD The new 2019 release of AutoCAD brings together the best AutoCAD features to date and puts them into one easy-to-use solution. AutoCAD 2019 brings you new workflows and an entire new product experience. Whether you use 2D and 3D CAD, create 2D or 3D models, manage drawings, or design for production and manufacturing, you can do it all with AutoCAD. Saving time with command extensions Command extensions, or commands for short, are the most versatile of AutoCAD tools. Command extensions enable you to perform multiple operations in a single step. They're great for repetitive tasks, such as creating and editing text or working with text objects, or for complex design or drawing steps. Import or export to/from.DWG or.DWF Many CAD editors and print-production facilities will only accept a DWG or DWF file format, so if you use AutoCAD to create those drawings, it's important that you can export your drawings in the required format. AutoCAD 2019 offers new command extensions to save the drawing and export it in one simple step. Load drawing parts into the Drawing & Annotation tab You can now load drawing parts and hide or show parts from your drawing simply by right-clicking on them in the Drawing & Annotation tab. Load drawing parts from your favorite 2D or 3D CAD or 3D model file, and then you can see a preview of what your drawing will look like when you close the drawing.
