R18 R18 (released April 2016) introduces a new drawing system, which allows for information to be presented in a new format and in a way that permits a user to work with the information intuitively, regardless of what type of information is being displayed. With the new system, a designer can edit data in a dynamic way, regardless of the data type, and can apply this editing to any object in the drawing. Data types are replaced with patterns, which are an abstraction of the data type that contain

the information in a standardized, uniform way. The new format is efficient, modular and scalable. It is the result of more than eight years of refinement, development, design and testing. It gives the designer the ability to work in a manner similar to the way that the data is represented in a software application. Because the format is modular and contains no arbitrary limitations, it can be used in an unlimited number of ways. It is based on a basic model that was first used in early versions of AutoCAD, and is now being used as the basis for many other applications. The ability to work in this dynamic, data-centric way also means that you can build applications that give the user more direct access to information, and to the various components of that information, than ever before. R18 is capable of representing all the AutoCAD drawing objects of a project, as well as their properties and attributes. R18 brings the designer full control over the user interface of a CAD application, enabling a huge range of user interface options. The new system also gives the user the ability to edit data elements in a way that is similar to how they are edited in a software application. Properties such as text, values, components and parameters can be modified directly. Data elements, including blocks, layers, blocks in layers and geometrical elements can be modified directly. Data elements that have properties associated with them (such as blocks, layers, blocks in layers, geometrical elements) can be edited directly, and a full range of data properties can be easily modified. R19 R19 (released October 2017) introduces many new features, and also has a major overhaul of the underlying infrastructure of the AutoCAD operating system. These include support for a newer operating system, a number of performance enhancements and improved stability. R19 includes a new system for sharing models, as well as an improved version of the existing feature. This means that when a model is shared

Taxonomic reassessment of the genus *Psilochilus* with description of three new species (Coleoptera: Scarabaeidae: Scarabaeinae: Lucaninae). We reinvestigated the morphological and anatomical features of *Psilochilus* for over 30 years, and proposed to revalidate *Psilochilus*, previously known as a monotypic genus, as the result of a systematic revision. We studied a set of 34 specimens representing all valid species of the genus and described *Psilochilus punctulatus*, *P. holosericeus* and *P. gallicus* as new species. We also revised the morphology of the
