Q: How to manage unit tests and build scripts in subversion I am using subversion for version control on my project. I have subversion repository for my code and I want to have another repository for tests. I know that if I create a project and add the tests to the project as another branch of the project then I could set up my build scripts to use my tests. But if I use a repository, where a repository is a directory in my subversion repository, then I would have to use a relative path for svn:externals. But if I do that then my build scripts can not find my unit tests. How to do it? Thank you. A: I would create a separate repository, and use one branch for your tests, and one for your code, and use svn:externals to "link" them together. I would start with "mocks" (unit tests) and then, move to production code. So, you could test your code using mocks that look like the real production code. Good luck! Check-in: 20:00 / Check

What's New In?

We've been working on a couple of things this year and one of them is a feature we call "Markup Assist". It's a new document-level user experience that can help you review and update existing drawings quickly and efficiently. This can be accessed through the ribbon by selecting Markup. You can also access it through the Customize ribbon for users who don't want the ribbon UI to be present in their view. As you can see from the video, you can use this feature in a number of ways. You can use the UI to upload and sync files from the cloud or on disk, you can send feedback using the mail icon or checkmark the appropriate boxes in the ribbon to display options. If you select one of the option the Markup Assist UI will display the information you need to make an update. To make changes you simply make changes to your drawing as you normally would, and then in the Markup Assist UI you can revise those updates. If you choose to go back into the UI you'll have a "back" button. If you choose to update your drawing you can click on the checkmark to send that version back to your drawing. If you have multi-level editing, you can choose what to send back by clicking on the Send Updates to Selection checkbox. If you have multi-level editing, you can choose what to send back by clicking on the Send Updates to Selection checkbox. You can also choose to leave the file on disk or upload it again by clicking the "Save" or "Send" buttons. And as you can see here, this UI supports collaboration by supporting two-way synchronization. If you have someone else working on the same drawing or file, you can review changes and then make updates that can be sent back to the original file or other users. This could potentially save you hours of work when you are making changes to your drawing. Markup can be added to any drawing type including AutoCAD Drawing, AutoCAD Project, DWG, DXF, DWF, PDF, DWF, KML, DWG, and DWF. You can use the Markup Assist UI in AutoCAD 2023 as an additive feature
