KPLive allows you to create a new restore system from scratch or you can mount any of your partitions and restore from it. The tool offers two different methods for the restoration, including the automatic recovery and the manual one. For the latter, you can use the

ntfs\_attr, noahdfear\_driver.sh, ntfs\_delete, ntfs\_recover, ntfs\_repair, mount, reparfs, rarfs\_remove, rarfs\_repair, syncdos and zfs\_recover commands. The automatic method helps you recover when you accidentally remove or corrupt the registry drive and it does so without it taking anything but a few moments. The tool is designed with a one-click installation and it saves all the information of the disk in a file, at the same time it creates the partitions.

Once the restore is ready, you can simply eject the live media and view and

restore the files manually or from the Live CD. The tool is also designed to create a report after it is completed and it shows the success or failure of the restoration. It also lets you modify some aspects of the registry. On the right pane of the tool, there are a few options and a menu bar that has three icons, including the Back, the Stop and the Restore buttons. They are useful to navigate between the different options. The tool offers a few advanced settings that help you to better access the disks, including changing the monitor resolution,
