Top This button denotes the overview of all the actions that were done while streaming. It changes from one number to the next whenever something interesting happens. The colors correspond to what action was performed: blue is used for analog movement, red and yellow for firing and projectile based actions, and green for grabbing or dragging. Middle This button shows for every controller the current settings. This can be an analog stick, a virtual joystick, or a combo of both. The blue area represents the movement, the red represents the shooting, and the yellow, the projectiles. Bottom This button lists for every controller the available presets. There are a great variety of presets, so take the time to learn what each one offers you. Custom presets can also be created. Left The left button displays the information that corresponds to the basic left controller buttons. Right The right button displays the information that corresponds to the basic right controller buttons. Side The side buttons display the information that corresponds to the side buttons. This is used when there is no analog movement on the joystick. ### What's New in the Open Joystick Display?

View Gamepad Data via UI Server from Player Stream Determine Controller Bindings and Button Layout Expose Joystick Data via Gamepad API Use Gamepad Data for Login / Registration Create Custom Bindings with Default Preset Change Gamepad Layout Presets to match your Game Easily Add External Patches to Gamepad Preset Add Gamepad Presets for Indicator Modes Not only can you enable other buttons, but you can change the mapping of those buttons to the control scheme your game supports. For example, if you are playing Super Smash Brothers, you would need to change the push buttons to be the same as in the controller you're using. Another nice feature is the ability to change the layout of the controller buttons. You can pick any style you want. The application is also capable of handling controllers when streaming. This has to be done through the plugin known as UDP. It would be possible to integrate it into this app but, again, it does not come with any visual representation of the controller's layout. It is displayed all the same, if the ports are correctly set up and the flow of data is properly handled. It does come with a server plugin, too. This has to be run on your streaming server. This could, however, be configured to fetch the needed controllers' layouts and send them to the client application for display. It could even do that automatically if an update is done on the client to match the rendered controller. You can configure Open Joystick to not display anything on your streams if you want. It wouldn't, however, stop you from setting up gamepads for use on your streams. Open Joystick is a free software download. It's easy to use, with a simple set up process, and works with a variety of controllers. They seem scattered and overwhelming, but this is not true. Each of the applications on this list has its own niche, and there is a reason for them.
