Microsoft Visual Basic was introduced in AutoCAD 2000. As of AutoCAD 2009 the VBA macro recorder is not available in AutoCAD and cannot be activated. AutoCAD Online is a cloud-based computer-aided design (CAD) solution designed for enterprise users to create and share 2D and 3D design and analysis applications. It is a web application based on .NET and HTML5 technology, and provides an API for the building of add-on applications. It can be used by companies of all sizes without investment in Microsoft software or servers. Autodesk sold the US division of AutoCAD to Autodesk in August 2008. In May 2017, Autodesk sold its AutoCAD business unit to Autodesk, Inc. KiCAD is a free software project for creating and operating an electronic hardware design software. It was started in 1996 by Dieter Meier and has been open source since 1996. As of August 2010, more than 45,000 users use KiCAD and more than 600 KiCAD-based designs have been built. Q: How to use Opencv2/Opencv3 for OS dependent project I want to port an opencv project to other OS. For this purpose, I created a Makefile for a Linux platform. So I copied all the files from the Linux folder to my own OS folder and compiled it. After that I copied the executable to another OS, set the path in makefile and tried to run it, it didn't work. It asked me to install opencv2/opencv3 and tried again, it still failed. I checked the build folder and found that most of the files are the same, but some parts are different, for example, the folder of opencv2 is under opencv2/build/, and in my case, I copied the opencv folder and copied the .so files there. Any idea on how to solve this problem? Thanks!

A: I had a similar problem, though I used git-buildpackage to build my own archive for other OS. As I posted in a separate answer, you can run ./configure --host= \$(uname) --build= \$(shell command which gcc) which means build for your own OS. See the link for details. Hope this can help you.

Edit: Another solution is by using git-submodules. In this solution, you have a directory named opencv2, so you have to add a new submodule to the parent git project. I tried this: # at opencv3/modules/opencv2/build/ # and build a new makefile. # git clone cd git+ git submodule update --init # change the folder to opencv2/modules/ # and build the makefile cd opencv2/modules/opencv/build/ # clean all folders for this solution rm -rf src/build # run make make The makefile is quite simple: # when the project compile, only configure and run the "python3" program # other commands like run testing for example
