Page C contains A. A contains B. B contains C. Page A's html structure is like this: a1d647c40b

Q: Add a class to first element of a CSS-structure after given time I want to add a class to the first element on a screen after three seconds. I want the first element to have the class active-navigation. I have tried many things and my question is that does this work or am I missing something here? Here is my code: `$(window).load(function() { setTimeout(function(){ $('<div>.menu-navigation-active-navigation').addClass("active-navigation"); },3000); });` A: Your current code is "trying" to find the class, but not targeting any specific element. Your selector should use an ID as a target instead: `$(window).load(function() { setTimeout(function(){ $('#menu-navigation-active-navigation').addClass("active-navigation"); },3000); });` Note that you can also use the first selector you tried, but add a div to make it so it doesn't work for the elements in a div. Then it will work properly: `$(window).load(function() { setTimeout(function(){ $('<div>.menu-navigation-active-navigation').addClass("active-navigation"); },3000); });` Additionally, you can change the first element to the first li element in the menu-navigation div, which will target the first element on the page in general. Also note that I've changed menu-navigation-active-navigation to #menu-navigation-active-navigation to make the target a more general one. `$(window).load(function() { setTimeout(function(){ $('#<div>#menu-navigation > li:first-child').addClass("active-navigation"); },3000); });` Example with a more general target: This invention relates to an improved method of welding, and more particularly, to an improved welding method for joining tubular members such as tube sheets or nozzle guide vanes

#### What's New In AutoCAD?

See the details AutoCAD 2023 introduces important updates that continue to improve the user experience in AutoCAD and enhance the workflow and functionality of the program. In AutoCAD, use the ribbon to accomplish everything from selecting to placing items. These updates make it much easier to select, place and manipulate objects. For example, the shortcut menu offers a variety of options for selecting objects, and the Search toolbar is easier to use than ever. The ribbon also gives you a better look at your drawings, and the ribbon buttons now appear on a layer at the right-side of the drawing window, helping you identify them. 2D Viewer Snap previews and a simple interface for reviewing your drawings in 2D Work with 2D drawings that have been created using other 2D applications and output formats, such as PDF, PS, JPG, PNG, and TIFF. AutoCAD 2D Viewer now makes these drawings compatible with AutoCAD and other applications. Simplify and speed up 2D review. The new 2D Viewer can generate basic annotations that guide you to the areas that need review and the information you need. It can also be used as a simple, fast review tool for reviewing drawings or getting information about the basics of a drawing, such as its extents and units. Create, display and edit annotations. AutoCAD 2D Viewer lets you generate annotations for a drawing that guide you through the review process. Annotations let you quickly get information about a drawing, such as its units, extents, dimensions, colors, linetypes, hatch patterns and more. You can view and edit annotations in any application that can view DWG files. 3D Modeling and 2D Viewer Stabilize your model with the new 3D Cursor The new 3D Cursor stabilizes the location of an object in 3D space and can rotate and translate the object. The 3D Cursor is particularly useful for creating 3D solids or for assembling models. For example, you can snap a complex 3D object to a surface. Automatically generate 3D solids. The 3D Cursor can automatically generate 3D solids when you move an edge or surface. 3D solids are especially useful for creating 3D shapes that need to be in a specific location in a drawing. Create and edit 3D solids. 3D solids enable you
