Until now I could not find a torrent for realflight 6.5, but I found one for the older version 6.3, I took out the crack and replaced it with the realflight 6.3 script. Install and Enjoy! Usage: In RealFlight, go to File > Preferences > Updates > Update RealFlight. (for 6.3) (for 6.5) Mar 13, 2020 RealFlight® is the industry-leading flight simulator for radio-controlled airplanes, helicopters, and drones. RealFlight, the only flight simulator that is completely open source, and available for all Windows and Mac operating systems. Bittorrent. I have an error when I launch. Warning "There is no executable code identified for your platform. For more information about installing.exe files click here" A: Seems to be a compatibility issue between.NET Core (Runtime >= 4.6.0) and RealFlight. The fix is to migrate to a version that runs on.NET Core 1.1 or later. You can find all the details in issue 139. It's working fine on Linux. Q: How to dynamically update a value of a field in a Ext.window component? I would like to update the name of a window, depending on a user input in another window (outside of the window I am in). What I have so far is: this.updater.on('afterrender', this.setLabel, this, this.getView().getComponent(this.labelField.id), this.labelField); The updater object is of type Ext.util.MixedCollection and it is an instance of Ext.util.MixedCollection.onchange event. The problem is that I don't know which field is the labelField, so I am doing something like the following: this.updater.on('afterrender', this.setLabel, this, this.grid.getComponent(id), this.grid.getComponent(id)); The id is the id of the field I am looking for, in my case: this.fieldId = this.store.baseParams.id; This approach works but updates the value of the field I 570a42141b
