The complexity of crude oil has made feasible only a limited number of techniques for recovering more of the resources of crude oil. One such technique is referred to in the literature as "enhanced oil recovery." This term is used to refer to a variety of oil recovery processes intended to take advantage of certain physical phenomena associated with crude oil or with formations in which crude oil is contained. Many of the processes involve contacting the oil with a fluid which has a different, usually higher, vapor pressure than that of crude oil. When the crude oil is gaseous under reservoir conditions, "pumps" can be applied to the formation or "injectors" can be used to add fresh gas to a portion of the crude oil. These make gas-entrapping the crude oil in a pocket. Certain types of crude oil contain high amounts of "asphaltenes" which are highly viscous oils of a complex composition. Asphaltene-containing crude oil is difficult to recover. When steam is pumped into formation containing such oil, only a few percent of the oil is displaced. The asphaltenes tend to precipitate and plug the formation producing a low recovery factor. Another type of crude oil contains large amounts of water which are not miscible with crude oil. Steam can be injected into the formation but the steam tends to dissolve the oil thereby greatly decreasing the amount of recovered oil. Still another type of crude oil contains paraffinic compounds which are difficult to recover. Another effective method for recovering oil from a reservoir

Many are fascinated with the idea, but not many have actually practiced it in a formal setting. There are many reasons for this. One of the reasons is that the traditional definition of mindfulness — the ability to pay attention and bring our attention to our surroundings in an accepting way — isn't always helpful. Here are some benefits for you:

Being mindful is beneficial in everyday situations. It can help you recover from an argument with your spouse, help you manage a difficult situation at work, and so much more. Mindfulness can improve your ability to do anything you set your mind to do. It can help you improve your creativity, learn something new, or do something completely new for the first time. You will be able to see and appreciate things you never noticed before. Mindfulness can help you become more patient and aware of yourself. It can help you focus on what you want to accomplish, and focus your energy in a way that is more productive, and less stressful. There are many scientific studies that demonstrate the benefits of mindfulness. One of the benefits of mindfulness is its ability to reduce stress. "Stress" is a way of describing your body's response to something in your environment that challenges the way your mind is able to function. When you are stressed, you are unable to see things as they are. When your brain responds to something, it controls your body and your emotions through a chain reaction. There are many reasons why stress occurs. One reason is that the mind has become stuck. When your mind is stuck, your brain becomes activated. Your body is then able to respond emotionally and physically. When your brain is in a state of stress, it creates a feeling of tension in your body. Mindfulness will help you to become more aware of the negative effects that stress can have on your body and mind 3e33713323
