History In November 1971, Gary R. Spilker, an engineering student at the University of Illinois, authored a draft of a functionalized illustration of the idea of having a computer system that could directly generate patterns for various engineering components. This became the beginnings of the first AutoCAD Crack For Windows. Spilker decided to go into business with another University of Illinois student, Wayne Leonard, with the assistance of their professor, Reuben B. Kline. In November 1972, a new business, AutoCAD Crack Corp., was formed. AutoCAD 1.0 was first sold in 1982, and a training version in 1983, with full production started in 1984. By 1989 AutoCAD was running on a combination of an IBM personal computer, an IBM RS/6000 SMP running the SYS 4 operating system, and the graphics system M10. By the 1990s, it was running on PCs running Windows 3.0 or Windows 95 with 16-bit Windows software, and in 1992, AutoCAD LT was released on 286 and 386-based computers. In 1996, AutoCAD and AutoCAD LT were available for the Apple Macintosh, and released on Windows 98. In 1998, Autodesk added Net, a web browser-based CAD tool, as well as feature to AutoCAD, such as text and tabular dimensions. In 1999, AutoCAD 2003 was released, followed by AutoCAD 2004 in 2000. The mobile version of AutoCAD was introduced in 2005, AutoCAD LT Mobile was released in 2006. AutoCAD LT Mobile is an alternative to AutoCAD LT, which has a considerably different interface and functionality. In 2008, AutoCAD 2008 was released, and AutoCAD Mobile was released in 2011. AutoCAD 2013 followed in 2013, and AutoCAD LT 2013 followed in 2015. AutoCAD LT Mobile was replaced in 2018 with a new mobile app, AutoCAD Mobile. In 2015, Autodesk announced that AutoCAD

2018 and AutoCAD LT 2018 were the last two releases of AutoCAD on Mac. AutoCAD and AutoCAD LT will be replaced by AutoCAD R20 and AutoCAD LT R20 in 2021. Features AutoCAD does not limit itself to the creation of geometric shapes. It supports a full range of drafting tools, such as polylines, solids, splines, lines, text, and tables. In addition, it supports text

1. Field of the Invention The invention generally relates to security and access control systems and more particularly to a novel system and method for identifying and recording unauthorized movement in a controlled area.
2. Description of the Prior Art The prior art is replete with devices and techniques for the detection and recording of unauthorized movement in controlled areas. The advent of computers has enabled the development of sophisticated analytical programs for identifying unauthorized movement. Examples of such devices and systems are disclosed in U.S. Pat. Nos. 4,213,028, 4,209,820, 4,165,895, 4,083,814, 3,975,573, 3,992,125, 3,942,219, and 3,839,727. While the prior art systems are quite suitable for their intended purpose, a number of problems and shortcomings have been encountered in their application. First, while prior art security systems are capable of recording and identifying unauthorized movement, such systems are generally intended to be permanently installed as part of a security gate or the like. It has become common to utilize temporary detection systems where the systems are intended to be installed on a premises for a short period of time. One such system is disclosed in U.S. Pat. No. 4,125,877. In such a case, a portable, hand-held device is utilized to detect unauthorized movement and the system is only used for a short period of time. Such devices are easily subject to damage and theft and the personnel responsible for monitoring the system are frequently required to observe the system continuously throughout the day, thereby resulting in a substantial monetary loss. While the prior art security systems are generally capable of recording and identifying unauthorized movement, the record of such activity is generally maintained for only a relatively short period of time. It is not uncommon for the user of a security system to make inquiries as to the particular location of a particular individual within a facility. Frequently, the exact location of the particular individual is unknown. If the system is capable of recording and identifying unauthorized movement, such information would be helpful in resolving such

inquiries. However, to a large extent, the prior art systems do not retain such information for a sufficient period of time and the information is therefore not readily available for subsequent inquiries
