In AutoCAD, each 2D object may be rendered in different color schemes and textures, depending on the needs of the drawing. For example, a model in color may be drawn with color=solid, while the background may be left to show transparent pixels. A drawing can be made up of one or more models, layers, colors, line styles, linetypes, polygons, points, dimensions, and text styles. Modeling concepts Before defining modeling concepts, such as tool settings, the user is given the option to 'Create a Template'. This tool allows the user to define a new default template for AutoCAD. These default settings can then be applied to all new drawings. A few basic concepts to define and understand: Modeling concepts are the "building blocks" of AutoCAD. They define the content of a drawing by defining their individual properties. These properties define the appearance and functions of a specific tool. Modeling concepts are: Models. Models may be groups of objects that are used to create the physical shape of the object. Different layers can be defined with different properties such as color, linetype, and line width. Layers are a software construct used to divide a drawing into different sections. These colors are stored as 16-bit unsigned integers in a computer. The standard colors in AutoCAD are defined in the color palette (00 - FF).
