Pretreatment of Tobacco with Citrus Peel Oil and Commercial Lime Juice Enhances Fungicide Residues in Tobacco Leaves. The phytotoxicity of citric acid (CA) and a citric acid-citrus oil (CO) mixture toward the growth of tobacco (*Nicotiana tabacum* L.) was investigated using an artificial climate chamber. Effects of CA and CO mixture on the growth of tobacco leaves were investigated in both hydroponic and soil systems, under different dose conditions. CA inhibited the growth of tobacco in both hydroponic and soil systems, while the CO mixture inhibited the growth of tobacco in the soil system. The CO mixture had a weaker effect on the growth of tobacco than the CA, and CA had a stronger effect on the growth of tobacco than the CO mixture. The potential of a CA and CO mixture to enhance the residual amount of fungicides in tobacco leaves was investigated using fludioxonil, pyraclostrobin, and cyprodinil. CA did not enhance fungicide residues, while the CO mixture enhanced fungicide residues. However, the CO mixture did not enhance fungicide residues for all fungicides, and other factors affected fungicide residues. to herself the right to print
