Whatever happened to this tool?Q: Prevent Java from redirecting to certain page if HTTP request fails? I am working on a simple client server communication project, which involves a server and a client. The server is hosted on Google App Engine. All the client does is display the server responses in a web page. Since I have not coded a lot of server side code and it was very easy for me to set up the server, the code in the client/server is pretty bare bones. In the server, I just read the HTTP response headers of the request and send the data back to the client. Although my code works fine, I do not want the server to redirect the client if the request fails. Since I am a newbie, I was not able to figure out how to do this. Could somebody please help me with this? The codes for the client server connections are given below. EDIT-1: I have changed the codes given below to reflect the suggestion that I should use custom http headers instead of putting the data in the body. But this does not appear to have worked out for me. /** * The http request handler for the hello_world server. * * @author mojomark * */ public class HelloWorldServerHandler extends HttpServlet { protected void doGet(HttpServletRequest request, HttpServletResponse response
