Launched to great fanfare, AutoCAD provided the first affordable CAD program for the general population. AutoCAD has since gone on to become the most widely used CAD program in the world and one of the most popular drawing programs. Today, AutoCAD is still one of the top-selling desktop applications for microcomputers, and has received multiple updates and new releases over the years, including two new versions in 2015: AutoCAD LT 2017 and AutoCAD LT 2017 R1. AutoCAD 2017 has been a notable release for both AutoCAD and AutoCAD LT users, as it boasts the newest release of AutoCAD: Windows 7 support. This version also provides new features and support for drafting on the iPad (iOS). Another significant update is the addition of a wide range of new features. AutoCAD 2017 has new tools for managing teams of users, and a system for collaborative input from mobile devices. This guide will help AutoCAD users learn about the latest features, tools and workflow enhancements that AutoCAD 2017 has to offer. Most of the new features are designed to help make drawing and layout work faster. This new functionality includes more collaborative drawing, better support for sheet metal, and better methods for drawing 3D objects. AutoCAD 2017 also includes the first release of AutoCAD LT for Apple's iPad. With AutoCAD LT, designers can create 2D drawings on the iPad. To help people learn AutoCAD more effectively, Autodesk has produced the following two training videos to show how to perform basic tasks in AutoCAD 2017: For more information, watch these videos, or read the following information in this guide to see how AutoCAD 2017 compares to older versions. Q: Reusing a Stateful Set/Deployment/Pod in different environments I have a deployment that uses a StatefulSet to host a Pod. The thing is I want to deploy it to a prod, stage, and dev environments. I want to reuse the same StatefulSet so that I don't have to deploy it to all three environments. Is this possible and how do I achieve it? A: It's not possible because the StatefulSet controller will create a unique Pods. This is the part of the StatefulSet.Run() method that will create a new pod if it doesn't already exist: // Create a new Pod, and set its name to match the StatefulSet's name. createdPod := c.podClient. Create(podSpec.Name, &podSpec) You can verify this by checking the Pods field in the StatefulSet. StatefulSet: StatefulSet controller creates a Pod matching the given statefulset name (objectName) and updates it with the StatefulSetSpec's template. If you want to share the StatefulSet, you'll have to write a controller that creates and updates the pods, and use it in three different StatefulSet controllers. (Ed's note: The last few months we've seen a lot of articles suggesting that, in order to not make our finances worse off, we should sell all of our stocks. This is a good reminder that we should be careful with what we sell and for what reasons. I think that, while a smart investor could have bought and held all of his stock, we need to make sure that we do what's best for our personal goals, family, and financial health, not just the investment.) Generally, a good selling method is one that maximizes your return and minimizes your risk, while being consistent with your goals and life goals. I personally have made some of my biggest investments in my life by selling all of my stocks and putting the money into investments with a much higher expected rate of return. I think it's a good idea to sell when there's a chance that you'll be needing the money for something
