Learning CAD To acquire the skill to manipulate CAD models, CAD users must first learn how to use the basic functions of the CAD programs. Most CAD programs include a default or "native" user interface that uses a mouse and menus for interacting with the program. A CAD user typically must read the printed manuals or user guides provided with the CAD program. The user is usually given an initial tutorial or "quick-start" mode to familiarize the user with the program's interface and purpose. CAD users are also usually given a basic tutorial mode that allows the user to learn the basic input of the program. Users may find it useful to develop an intuition about the CAD program by practicing on a model that is already completed. Once CAD users understand the basics of the program and have developed a level of intuition about the program, it is useful to start creating customizations, add-ons, plug-ins, macros, and templates to the program. Rigorous study of a comprehensive text such as CAD Fundamentals provides an overview of the subject. Another standard text is CAD/CAM Fundamentals, although this is oriented towards CAD/CAM products.
