AutoCAD Basics AutoCAD is a computer-aided design and drafting program, with many key features missing from most other software applications. The program is designed to create three-dimensional, two-dimensional, and planar drawings, as well as layouts. AutoCAD is an intelligent application that supports a large number of ways for the user to interact with the computer and execute commands. The AutoCAD keyboard commands can be classified as follows:

- ** First- and second-generation commands: These commands accept and respond to input that is linked to a specific entity (feature, object, object property, etc.) or to the active drawing page.
- ** Second-generation commands: These commands respond to input based on the contents of an entire drawing or the entire model.
- ** User-defined commands: These commands are linked to the AutoCAD user interface (UI) and can be invoked by using an object-oriented programming method or a command line method.
- ** Third-generation commands: These commands are linked to the user interface and are designed to replace the user-defined commands.
- ** AutoLISP: This is an extension to the AutoCAD programming language that includes an interactive development environment to create macros or automation scripts.
- ** Coordination windows: These windows are windows that can be overlapped, moved, resized, or closed without regard to the original position of the window. The windows can display geometry or text information.
- ** Parameter Windows: These windows can display or change settings for a drawing.
- ** Tool Palettes: These windows can contain tools that can be invoked in the context of a drawing or be linked to a command.

AutoCAD has a wide range of functionality. Although the total number of commands and function available in AutoCAD is almost limitless, some basic commands can be used to draw simple shapes, format text and drawing objects, generate new layers, and animate elements of drawings. The most important AutoCAD commands include the following:

- **Create: This command creates new drawings.
- **Select: This command selects objects and entities and then allows the user to perform actions or change attributes on the selected objects.
- **Perspective: This command changes the view of the workspace or changes the perspective of the view.
- **Toggle Auto Zoom: This command switches between high-quality, medium-quality,

Q: How do I write a post-build event in Visual Studio 2010 for Cake? I've written a command-line application for C# using Cake. I can run the program by typing `cake.bat fileName.cake`, but I need to be able to run it from the Visual Studio 2010 GUI. How do I write a post-build event for Visual Studio 2010 using Cake? A: Cake is a CLI tool, so the only way to run it with Visual Studio is to use the standard "Executable Post-Build event" button. If you have a batch file that calls Cake like `cake.bat fileName.cake` it should work fine in this case. If you want to be able to run Cake from within the Visual Studio IDE, I believe you'll have to write an extension that's capable of running the Cake CLI at runtime. Cake supports this through their command line interface. I can't say exactly how to do it as I haven't tried myself. If you need help writing an extension, you may want to look at the information on the Cake site on the extensibility options.

Q: Clojure a ring for the Groovy base collection class? Is it possible to create a Ring for the Groovy base class, and then extend it with collection classes like `clojure.lang.Associative`, `clojure.lang.Bag`, etc? Or do I have to convert the whole collection-based classes to clojure-based ones? A: I haven't tried this, but I assume you can just write a file of `defmulti doSomething [1 2 3] (defn doSomething [f] f)` in your project's namespace and use `lein run-main` when you run it. I would be curious to hear what sort of output you get. [Parotid, submandibular, and sublingual glands swelling with sclerosis as the first symptom of multiple myeloma].
