Adenovirus infection causes oncogenesis in a variety of different organs including the liver.

After viral infection, the virus first replicates in the lower half of the cells, causing the cells to enter into the S phase of the cell cycle. This is followed by the synthesis of early viral proteins and finally the late proteins, which are required to assemble the progeny virus. The E1A gene is expressed from early time points of infection and encodes an early viral trans-activator protein that regulates the expression of many viral and cellular genes. It is regulated at the transcriptional level in part ca3bfb1094
