X-Plane 11 has a wide variety of airports for you to fly around. These airports range from small private-sector airports to large international airports. All of them were personally researched and designed by the developer. In addition to this, each airport was optimized for flight simulation in X-Plane 11 with optimized scenery and lighting. The all-new Scenery Elements, which are in the process of being developed for X-Plane 11, are also used to provide high-quality, 3D buildings, aircraft, and scenery for X-Plane 11. With the introduction of X-Plane 11 for Mac/PC, the developer has also implemented X-Plane 11 for Mac and Windows. In the case of X-Plane 11, the challenge was to develop a model of the airport that was realistic and presented a detailed depiction of the airport's surroundings. The developer wanted to create a realistic model that would serve as a benchmark for future airport designs. With that in mind, a very detailed model was created, allowing for extremely detailed ground elements, buildings, and scenery. It is also important for the developer of X-Plane to create a model that is easily understood and intuitive for the user to control. The model contains elements that are the most useful to pilots, and this model focuses on the objects that are essential and most important for use. Even though the model of the airport and its surroundings of X-Plane 11 is sophisticated and carefully designed, a useful cockpit is even more complex and difficult to reproduce. A wide range of objects and buildings are required for simulating an intuitive cockpit. About World Aeronautic Simulations World Aeronautic Simulations is a large company that deals primarily with airport design and development. As such, the developer team is best known for the more than 60 airports that are in the current release of X-Plane 11. This freeware offers an extensive range of airports to fly around, ranging from small airports to large international airports. Our greatest ambition is to offer the most realistic simulation of an airport in X-Plane. For this reason, the airport development team works hard to collect a large number of already existing airports and combine them into a single comprehensive model. Due to this, there is no need to worry about the airport you fly into. An airport that has been developed by us will guarantee that your X-Plane has a high-quality flight simulation. ? by Jed (Afterheavy747@aol.com) This is part of my new long series on the various tanks of WW2. If there is anything you think needs a detailed review post please PM me. This post is about the Tiger ME67. This tank has a very interesting history. Designed to do battle with the mighty German Tiger I, the Tiger ME67 had alot of flaws, and was a major disappointment in what were not only its intended purpose, but in what the rest of the Tiger family was able to be. Constructed with a main battle tank chassis, two driver's and four crew, Tiger tanks were generally deployed as infantry support tanks, sacrificing their mobility in exchange for more firepower and armor. This was something the ME67 specifically was not designed to do. Other features the ME67 had that made it very frustrating included...it lacked a FL mantlet and instead had the 7.92 muzzle-loading turrent in a box on the back of the turret.Its suspension was insufficiently strong and so it was hard to steer in muddy conditions like the real Tiger I was.A shortage of 3.7 inch and 66 caliber main guns meant that the ME67 could not operate the short ranged anti-tank 76mm Pak43/t and 88mm Pak43 anti-tank rifles.The turret also lacked an internal compass which limited the crew from knowing the orientation of the tank.The turret was also large and heavy, making the shell load and reload harder than that of the other Tiger tanks. With the introduction of the Tiger II these flaws were reinforced by the addition of the turrent in the hull and the change from an external to internal load of the main gun. Here is a picture of a Tiger II in a plume of smoke with the additional load mechanism in its nose. However, the Tiger II ME67 was just as troublesome when it came to tracking, driving and starting. In this case, all of the new problems were compounded by the installation of the FLMG. The HEAT missiles it launched produced a mushroom cloud of flame and the smoke gave away the position of the tank from over a kilometer away. In active combat situations, it was dangerous to fire the Main Gun at the missile, as it would only shoot off and kill its crew or fling off the HEAT missile.The Tigers were simply not well suited for anti-tank warfare. Nowhere was this more evident than the drive line...there was no sprocket drive
