Separation Processes Clinical variables as predictors of exercise capacity in chronic obstructive pulmonary disease. To study the influence of clinical variables on exercise capacity in subjects with chronic obstructive pulmonary disease (COPD). An initial study was carried out in 19 patients with COPD (mean FEV(1) 1.24 +/- 0.2 liter). They performed a cycle ergometer test to determine the maximum capacity to sustain an incremental exercise test (peak exercise VO(2)). Fourteen patients (78%) met the criteria of abnormal effort based on the diagnostic criteria of the American Thoracic Society. In an attempt to determine whether the variables studied were related with peak VO(2), a multivariate analysis was performed. Peak VO(2) showed a positive and significant correlation with a number of variables: sex (P
