expensive? I have a program where we process a large amount of data. I'm using a HashMap for my data structure. After every iteration through my program, I add my data to the hash map. My question is: is it worth iterating through my hash map once every 1000 iterations? A: it's not, so only go as fast as you need, be careful. A: There's no reason to pre-hash, unless you are trying to reduce memory usage at the expense of 0cc13bf012
