Field of the Invention This invention relates to a linear Fresnel lens and a device using the same and, more particularly, to a linear Fresnel lens used as a focus device in a telephoto lens of a single lens reflex camera and the like, and a device using the same. 2. Description of the Related Art A single lens reflex camera of this kind is provided with a focal-plane shutter and comprises a mirror for guiding a light flux of a photographic scene to the inside of the camera body, a first linear Fresnel lens mounted between the mirror and the shutter, and a second linear Fresnel lens mounted between the first linear Fresnel lens and a shutter curtain. The focal-plane shutter is of a type in which the first and second linear Fresnel lenses are arranged to form a focus optical path of an optical system, with an optical axis perpendicular to a surface for exposing the photographic film to the optical system. In such a focal-plane shutter, it is required that the first and second linear Fresnel lenses are used as a focus device. As a focus device, however, it is usual to use lenses such as a zoom lens whose focal length is variable. This invention has been made in view of the above problems of the prior art, and an object of the invention is to provide a focus device which has a simple arrangement and can use a plurality of kinds of lenses as the focus lenses. In order to attain the above object, in a first aspect of the invention, a linear Fresnel lens comprises: first and second lens groups including at least first and second linear Fresnel lenses; and a lens movable in a direction perpendicular to an optical axis in a plane where a light beam comes in contact with the linear Fresnel lenses, the first linear Fresnel lens being a negative lens, the second linear Fresnel lens being a positive lens. The first and second linear Fresnel lenses comprise: a plurality of convex lens surfaces; and a plurality
