The authors present a case of a 49 year old lady with chest and neck pain, palpitation, and dyspnea. She had a history of deep vein thrombosis of the inferior vena cava and was given heparin treatment. On admission she was in extremis and hypercoagulable. Echocardiography revealed a large thrombus in the right ventricular cavity, so that Impella CP and Rotaflow pump were used. She was then given Heimlich and Shikani maneuvers. Hemodynamic status was stable after three hours. Thrombolysis was not used because the patient did not wish it, and there was no need to prolong anticoagulation because of the known, heavy thrombosis.Phosphoinositide 3-kinases are essential for platelet-dependent arterial thrombus formation. Phosphoinositide 3-kinases (PI3K) are lipid kinases that are involved in a variety of signaling events in the cytosol and in membranes. Here, we use in vivo thrombosis assays and pharmacological inhibitors of PI3K to study the role of PI3K in platelet-dependent arterial thrombus formation. Platelet-dependent thrombosis in the carotid artery of mice was inhibited by the PI3K inhibitor wortmannin and by pharmacologic inhibition of PI3K, but not by inhibition of either P2Y(1) or P2Y(12). Wortmannin had a selective inhibitory effect on PI3K with no effect on c6a93da74d
