Simona Agosto Abul Khair.Q: How to close a python script after typing a command? i have a python script witch i have to execute with subprocess. i want to run the script, then type some command and after it i'd like to close the script. I don't want the script to close as soon as i write the command. I was thinking something like: try: command = input("Write command: ") except: break try: print("my script" subprocess.call(['python','my_script.py']) except: break try: print("I want to close the script now" break except: break Could you please help me? A: You can call input inside a thread, and trap it using a signal handler with a global lock. See here for an example. To terminate the script you can use a custom signal handler, and generate it in the main thread. For example: import signal import sys import threading def signal_handler(signal_name, signal_no, frame): global lock, my_exit with lock: my_exit = True signal.signal(signal.SIGINT, signal_handler) lock = threading.Lock() try: while True: command = input("Write command: ") if command == 'exit': signal_handler(signal.SIGINT, signal.SIG_DFL, None) break c6a93da74d
