Distribution of *Pseudophyllobacter* (Xantomonadaceae) species (*Phycisphaera jejuensis* sp. nov., *Pseudomonas jejuensis* sp. nov.) isolated from water environments in Korea. Twelve bacterial strains, designated as PRJ-1T to PRJ-12T, were isolated from wastewater and seawater in Korea and they were characterized using the taxonomic criteria of a polyphasic approach. They were Gram-staining, motile, aerobe, strictly aerobic and purple-pigmented (with a substrate and oxygen as the only electron acceptors) bacteria that produced indole from tryptophan. The DNA-DNA hybridization value between strain R59T and *Pseudomonas kunmingensis* KTR-9 was 52.3 %. Phylogenetically, the strains formed a distinct lineage in the genus *Pseudophyllobacter* and exhibited the highest similarity (85.9 to 88.8 %) with *P. kunmingensis* KTR-9T, the type strain of the species. The G+C content of the DNA was 70.2 to 72.1 mol%, the predominant respiratory quinone was Q-10 and the major fatty acids were summed feature 3 (comprising C16 : 1ω7c and/or C16 : 1ω6c), C16 : 0 and C18 : 1ω7c. On the basis of phenotypic and chemotaxonomic properties, the isolates were classified as representatives of a novel species of the genus *Pseudophyllobacter*, for which the name *Pseudophyllobacter c6a93da74d*
