\*FREE\* activation. 7/18/11 Update: The VHD student key/code was taken offline.. (which we can email to you). Differential effects of 2-chloro-L-phenylalanine on gamma-aminobutyric acid and serotonin in the spinal cord of the pregnant rat. Pregnant rat spinal cord exhibits a selective enhancement of GABA levels during pregnancy (delta = 45.7% above control) while the concentration of serotonin declines to 25% of control (N = 18; P less than 0.01). The selective enhancement of GABA levels during pregnancy could be explained by a selective increase in the activity of the enzyme glutamate decarboxylase which synthesizes the transmitter GABA from L-glutamate. In contrast, spinal cord levels of 5-hydroxyindoleacetic acid and 5-hydroxytryptophan remain normal during pregnancy. In the spinal cord of pregnant rats treated with an inhibitor of glutamate decarboxylase, 2-chloro-L-phenylalanine (2-Cl-Ph), the level of GABA was decreased to approximately 60% of control (P less than 0.001), the decrease in GABA being much
