[Download](#)

radius attributes help the client calculate the mic. from eap, the client initiates the authentication exchange with the radius server, not with the ieee 802.11 authentication server. the client receives the username/password, two-factor authentication tokens, and token ip address information. during the authentication exchange, an ieee 802.11 authentication exchange is not performed. in this phase, the client sends the eap request to the radius server with the eap method specified. the eap method, such as eap-mschapv2, is specified in an ieee 802.1x authentication data (ad) request. the radius server validates the request and forwards it to the ieee 802.11 authentication server. some users were having trouble connecting to their wireless networks from an embedded system running windows 10 enterprise that is on domain and that has the networksecuritygroup policy set to permitall. this article presents a workaround to connect to the network from the embedded system. to configure the embedded system, users need to go to the group policy management console. on the administrative templates tab, select the win32 applications tab. select the modify link and then select network policy configuration settings. in the network policy configuration settings window, click add policy.. and select add next to network connection security. this action will open the network connection security settings window. select the network type (for example, home network connection or virtual private network (vpn)), then select allow connections from this host when it's in a domain-joined state.
