

The pilot stage of our research has focused on two areas. The first area is our proof of concept. This project led us to the requirements and design of the WEBTV activity manager. The second area is the building of the simulation software: we have built one of the simulator components and tested it extensively with the instructors and students. We will build two additional simulator components and test these as well. The training content that is available through this simulation software will be based on the simulation activities that we build. The simulator software requires the execution of the activities that we build and therefore, a design of the execution software is also necessary. The overall objective of this project is to develop a web-based application that will provide the instructor and students with teaching and learning support to enhance science and technology education. This will be achieved through the design and development of a web-based application that will be used by both the instructor and students to execute teaching activities. As the project unfolds more and more details emerge. These are being integrated into the software. Currently, the project is being developed using all of the following aspects: We have developed the software in Java. We have used a network server for dynamic client-server interactions. The client is the browser. We also have a web server that will manage the state of the application for us. The JDBC component is used to access the database. The data is stored in the database.

This investigation has demonstrated for the first time that a computer simulation methodology can be used advantageously for determining the effect of design layout change of a complex workstation, such as a supermarket grocery checkstand. The 13th edition of Methods, Standards, and Work Design will provide practical, up-to-date descriptions of engineering methods to measure, analyze, and design manual work. The text emphasizes both the manual components and the cognitive aspects of work, recognizing the gradual decline of the manufacturing sector and the growth of the service sector. The importance of ergonomics and work design as part of methods engineering emphasizes not only increased productivity, but also to improve worker health and safety, and thus, company bottom-line costs. In the twenty-first century it is essential that the industrial engineer consider both productivity issues and their efforts on the health and safety of the worker. This comprehensive text addresses this need by integrating the traditional elements of motion and time study along with the human factors and ergonomics and safety engineering. The 13th edition of Methods, Standards, and Work Design will provide practical, up-to-date descriptions of engineering methods to measure, analyze, and design manual work. The text emphasizes both the manual components and the cognitive aspects of work, recognizing the gradual decline of the manufacturing sector and the growth of the service sector. The importance of ergonomics and work design as part of methods engineering emphasizes not only increased productivity, but also to improve worker health and safety, and thus, company bottom-line costs. 5ec8ef588b
