
Orbit [EXCLUSIVE] Downloader V41113

the latest update of orbit downloader is a major release. it is version 4.1.18 and was released on february 1, 2012. it is available for free and works on all the major operating systems. the developer has released a new version of the program every year since 2007 and has released new features every year since version 2.0. orbit downloader has an easy interface that is very simple to use. it will detect when you launch it automatically and check for updates, so users don't have to bother themselves with that. it has a simple interface that allows users to download files directly from web pages. the code communicates with a server at orbitdownloader.com which ultimately provides the urls to be attacked. eset doesnt say whether or how often the attack tool may have been used in the past, but makes it very clear how effective it could be. given the age and the popularity of orbit downloader (it is listed as one of the top downloads in its category on several popular software web sites) this means that the program might be generating gigabits (or more) of network traffic, making it an effective tool for distributed denial of service (ddos) attacks. orbit downloader can be used to download streaming videos. this is because orbit downloader supports http/ftp/https/rtsp/mms/rtmp protocols. apart from this, you can download streaming music and video from almost any website, including, bebo, dailymotion, hi5, pandora, myspace, metacafe, tumblr, veoh etc. the list goes on. what is unusual, though, is to see a popular utility containing additional code for performing denial of service (dos) attacks, which is exactly what our threat researchers found during an otherwise routine examination of the orbit downloader software package. given the age and the popularity of orbit downloader (it is listed as one of the top downloads in its category on several popular software web sites) this means that the program might be generating gigabits (or more) of network traffic, making it an effective tool for distributed denial of service (ddos) attacks. eset identifies versions of orbit downloader containing this attack code as win32/ddos.orbiter.a.

Orbit Downloader V41113

recent versions of orbit downloader, a popular windows program for downloading embedded media content and other types of files from websites, turns computers into bots and uses them to launch distributed denial-of-service (ddos) attacks, according to security researchers.

numerous comments in the eset forum are recommending that the downloaders should be blocked until the developers address this issue. if eset had done so in 2006 when it first found the dos tool on the web, we might not have had a distributed denial of service (ddos) attack today.

while this may be the first time eset has encountered such a program, it is not the first time a free online file downloader has been compromised. in a post to the eset blog, david kaye, director of the eset virus lab, noted that eset scans for more than 1.5 million virus and spyware samples every day and is constantly expanding its virus database, which has resulted in eset identifying various variants of the zeus banking trojan. the zeus banking trojan is a variation of the zeus trojan and was first identified by kaspersky labs in 2009, noted kaye. it was quickly spread via compromised websites and affected more than 20 million users worldwide, including the u.s. federal bureau of investigations. before attempting to download the file, orbit downloader checks to see if the user has permission to perform the download. if not, it will present a message asking the user to grant permission to install the application. if the

executable is a dll file, orbit downloader will attempt to download the file, and then extract the binary. it will also set the values of environment variables username and userdomain, which contain the username and domain of the user that installed orbit downloader. this is similar to the logic employed by the kali autoruns project. 5ec8ef588b
