Silent Hunter 5 Cheat Engine

each game has a different memory layout. in pc games, game data is typically found in a separate heap memory range. the game is a big part of the memory and almost all game data are saved there. the data, in most cases, is saved in a particular order and you must find the correct memory address of the data you are looking for. the game can contain multiple heaps but a cheat engine can only modify one of them at a time. if a game has two heaps, then you will find them in the 0x80-0x90k and 0x100-0x1100k ranges of memory. the memory address where the game data is stored depends on the game itself. for example, h1p1.2 points to the h1p1.2 heap and e1p1.2 points to the e1p1.2 heap in h1p1.2. these heap addresses are defined in the game settings. for example, if you have h1p1.2 enabled and you search for a cheat engine, then you can find all the game data in the 0x100-0x1100k range. there are memory address ranges like the above heap memory ranges where you can modify data. the memory address range depends on the game. for example, supertux2 uses the 0x0000-0xffff range. this range can be modified using cheat engines. but the memory address range is different in every game. just remember the above range if you are planning to use a cheat engine. the memory address of the heaps can be modified using a cheat engine. game data is stored in the heap memory address range. the memory addresses of the heaps can be altered using cheat engines. and that is the reason why they are used for modifying game data. as a rule of thumb, you shouldnt modify memory addresses of the heap memory where data is stored. in most games, this range is 0x1000-0xb000 and 0x100-0x1100k. 5ec8ef588b
